Acknowledgments

No one achieves something great without the help of those around them, whether directly or indirectly. To complete this capstone project, we were fortunate to receive tremendous support and assistance from our supervisors, lecturers, friends, and family. We would like to dedicate these opening pages to express our sincere gratitude to everyone who has accompanied us throughout this journey.

First and foremost, we would like to express our deepest appreciation to all the lecturers at FPT University Hanoi Campus, particularly those in the Information Technology Department. The valuable knowledge they have imparted, along with their dedicated support throughout the implementation process, has enabled us to complete this capstone project and achieve noteworthy results.

We would like to extend our special gratitude to our supervisor, MSc. Trịnh Tiến Đạt, and our co-supervisor, Dr. Nguyễn Anh Nhật, who have inspired us, provided dedicated guidance, and offered invaluable support in terms of knowledge. They have created a favorable environment for us to learn and exchange ideas with fellow students in the research group. These are precious knowledge and experiences that will benefit us not only in this capstone project but also in our future careers.

Finally, we wish to express our heartfelt thanks to our families and loved ones, who have always been our solid support and have encouraged every decision we have made.

Despite our best efforts to make this thesis as complete as possible, shortcomings and limitations are inevitable. We sincerely hope to receive your understanding and constructive feedback from our supervisors and readers.

Abstract

A good abstract is a stand-alone summary of the paper, and should summarize the key components of the manuscript. Generally, the abstract should be concise and informative within 200-300 words. As an abstract is a separate section, it should be a self-containing text (no abbreviations, no references, no URLs, no undefined concepts, etc.). For research articles, abstracts should give a pertinent overview of the work. We strongly encourage authors to use the following style of structured abstracts, but without headings: (1) Background: Place the question addressed in a broad context (research background) and highlight the purpose of the study; (2) Methods: Describe briefly the main methods or treatments applied; (3) Results: Summarize the article's main findings; and (4) Conclusions: Indicate the main conclusions or interpretations.

Keywords: cybersecurity, information security, threat analysis, resilience

Chapter 1

Introduction

1.1 Background

The explosive growth of the Internet of Things (IoT) has led to the connection of billions of devices, continuously generating massive amounts of data. However, data processing at the edge (Edge Computing) faces significant challenges due to hardware limitations [1]. A specific characteristic of most IoT devices is their severe constraints in computational capabilities, storage space, and battery power [2]. In this context, Intrusion Detection Systems (IDS) play a pivotal role in monitoring traffic and protecting networks from cybersecurity risks, especially complex attacks. Recently, Federated Learning (FL) has emerged as an ideal decentralized solution. This approach allows multiple devices to collaboratively train a machine learning model without sharing raw data, thereby resolving data privacy issues and minimizing communication costs.

1.2 Problem Statement

Despite providing an effective distributed solution, deploying IDS in real-world IoT environments via Federated Learning still encounters core challenges. The first is the risk of privacy leakage: During the transmission of weights or gradients between devices, users' sensitive information remains at risk of leakage [3], enabling attackers to reconstruct the original data [4] and execute Model Inversion Attacks [5]. The second is the Data Imbalance problem: In IoT network traffic, normal data accounts for an overwhelming proportion, while attack traffic samples are highly rare. Practical evidence from the UNSW-NB15 dataset shows that there are up to 1,064,987 normal samples but only 22,215 attack samples [6]. This severe

imbalance degrades IDS accuracy [7] and directly hinders the feature extraction performance of deep learning models [8].

1.3 Research Objectives

To address the aforementioned limitations, this research proposes a comprehensive framework with the following specific objectives: The FL model will act as a distributed model among Edge Devices, facilitating devices to transmit trained weights to the server to build a secure IDS for the IoT environment. Integrate advanced secure computation methods, namely Secure Aggregation and Differential Privacy, into the weight transmission process to defend against data leakage attacks, ensuring the highest level of privacy. The FL model will integrate the CVAE (Conditional Variational Autoencoder) model to generate synthetic attack data, helping to balance the dataset for the minority class, thereby making IDS training more efficient and accurate.

1.4 Significance of the Study

This research holds significant importance in simultaneously addressing two difficult problems in IoT network security: data quality and privacy. By integrating data generation to balance the minority class and applying a distributed training model accompanied by strict security mechanisms, this project provides a comprehensive IDS solution that completely protects sensitive information before data is aggregated.

1.5 Scope and Limitations

- **Scope:** The project focuses on processing within an IDS in an IoT environment. The generation of balanced data is performed through the CVAE model combined with a distributed Federated Learning architecture at Edge Devices, along with weight protection mechanisms including Secure Aggregation and Differential Privacy.
- **Limitations:** Secure computation and synthetic data generation mechanisms require a certain amount of resources; therefore, they may face challenges when deployed on resource-constrained IoT devices [2]. Furthermore, the evaluation is primarily based

on standard offline datasets, which may not fully reflect the continuous evolution of real-world zero-day attacks.

1.6 Thesis Structure

- **Chapter 1: Introduction:** Presents the project's background, objectives, research scope, and the structure of the thesis.
- **Chapter 2: Literature Review:** Evaluates existing studies and demonstrates how this thesis fits into the broader academic context.
- **Chapter 3: Methodology:** Details the research design, data collection methods, and modeling techniques.
- **Chapter 4: Experimental and Results:** Provides a concise and precise description of the experimental results and system evaluations.
- **Chapter 5: Discussion:** Discusses and interprets the significance of the findings from the experimental results in a practical context.
- **Chapter 6: Conclusion and Future Work:** Summarizes the main contributions and proposes future research directions.

Chapter 2

Literature Review

Reviews relevant existing research and demonstrates how your thesis fits into the broader academic conversation.

2.1 Review of Previous Studies

2.2 Summary of the Literature Review

2.3 Contribution of Research

Chapter 3

Methodology

Describes the research design, data collection methods, and analysis techniques.

- 3.1 Research Design**
- 3.2 Data Collection Methods**
- 3.3 Sampling Data Analysis Techniques**
- 3.4 Limitations of the Methodology**

Chapter 4

Experimental and Results

Provide a concise and precise description of the experimental results, their interpretation as well as the experimental conclusions that can be drawn. You should discuss the results and how they can be interpreted in perspective of previous studies and of the working hypotheses.

4.1 Introduction

4.2 Presentation of Data

4.3 Analysis of Results

4.4 Interpretation of Results

4.5 Comparison with Literature

4.6 Implications of the Results

Chapter 5

Discussion

The findings and their implications should be discussed in the broadest context possible and limitations of the work highlighted.

5.1 Restate the Research Problem or Objectives

5.2 Summarize Key Findings

Chapter 6

Conclusion and Future Work

The 'conclusions' are a key component of the paper. It should complement the 'abstract' and is normally used by experts to value the paper's engineering content. A conclusion is not merely a summary of the main topics covered or a re-statement of your research problem, but a synthesis of key points and, if applicable, where you recommend new areas for future research.

6.1 Conclusion

6.2 Future Work
